Silos-Santiago I;

New human transferase protein for diagnosing and treating disorders e.g. cancer, Alzheimer's disease, anorexia, diabetes and to identify modulators for therapeutic use.

Claim 1; Fig 16; 143pp; English.

The invention relates to an isolated human kinase polypeptide encoded by the DNAs designated 16658, 14223 and 1602 including fragments, chomologues and allelic variants. Also included are a host cell comprising the DNA, an antibody which selectively binds to the novel kinase, a method for producing the novel kinase comprising culturing the host cell and recovering the protein, detecting the presence of the DNA in a sample comprising contacting the sample with a compound which selectively hybridises to the DNA and determining whether the compound has bound and identifying compounds which bind to and/or modulate the protein comprising contacting the protein with a test compound and determining whether the compound has bound a cand/or modulate the function of the protein (the modulators may be a small molecule, a peptide, a phosphopeptide, an antibody or a fragment of the full length protein). The uncleic acids, proteins, identified modulators and antibodies are useful in the diagnosis, monitoring and treatment of a wide range of diseases and disorders (many examples of which are listed in the specification) including cellular proliferative disorders (e.g. cancers of the lung and breast; carcinomas, tumours, adenocarcinomas, haematopoietic neoplastic disorders e.g. leukaemias and lymphomas), brain and nerve tissue disorders (e.g. cerebral ischaemia, infections such as meningitis, brain abscess, acquired immunodeficiency syndrome (AIDS)-related myopathy, prion diseases, Alzheimer's disease, Parkinson's disease, Huntingron's disease and motor neurone disease) metabolic disorders (e.g obesity, anorexia nervosa and diabetes) pain disorders (e.g. associated with infection, inflammation ischaemia, irritable bowel syndrome), heart disorders (e.g. myocardial infarction), blood vessel

AASO6701-AASO6757 encode for novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polynucleotides corrected the conding protein kinases and the polypeptides may be used in the prevention, diagnosis and treatment of disease associated with carecter (especially cancers of hematopoietic origin), cardiovascular cancers (especially cancers of hematopoietic origin), cardiovascular disease (e.g. atherosis), metabolic disorders (e.g. diabetes), infamantors of sorders (e.g. diabetes), infamantory disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. infertility).

Additionally, polynucleotides encoding protein kinases may be used for gene therapy and as DNA probes in diagnostic assays. The protein kinase against the protein kinase sand in assays to identify modulators of protein kinase expression and activity

The invention relates to novel human kinase proteins (PKIN) and nucleic acid molecules encoding them. PKIN is useful for identifying compounds that modulates its activity. PKIN cDNA is useful for assessing toxicity of a test compound. PKIN and its cDNA are useful for assessing toxicity of a test compound. PKIN and its cDNA are useful for assessing toxicity of efficiency syndrome (AIDS), Addison's disease, anaemia, adult respiratory distress syndrome, allergies, amyloidosis, psoriasis, autoimmune thyroiditis, multiple sclerosis, asthma, acteoathritis, osteoaptrosis, rheumatoid arthritis, ulcerative colitis and diabetes mellitus; growth and developmental disorders such as actinic keratosis, arteriosclerosis, atherosclerosis, bursitis, cirrhosis, cancers such as adenocarcinoma and leukaemia, cardiovascular diseases such as myocardial infarction and Mypertension; and lipid disorders such as fatty liver and cholestasis. PKIN cDNA is useful to detect upstream.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequences such as promoters and regulatory elements, for creating knock in or knock out in humanised animals or transgenic animals to model human disease and for somatic or germline gene therapy for treating the above mentioned disorders. The present sequence is human kinase (PKIN)-2

cytostatic, cardiant, antiarteriosclerotic, affiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX9708-3185 are CDNA fragments amplified and isolated by the PCR primers and probes represented in ABX13460-ABX13462 and ABX97186-ABX97185. This invention describes novel human NOVX polypeptides which have ABU65041-ABU65218

activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX9708-ABX97185 are CDNA fragments amplified and isolated by the PCR primers and probes represented in ABX13460-ABX13462 and ABX97186-ABX97993. ABX97084-BCR canced the NOVX proteins described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      480

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                Determining if a compound induces a toxic effect on a tissue or cell, for identifying hepatotoxic compounds, comprises comparing a gene expression profile of a tissue or cell sample to a database of Tox mean and non-Tox mean values.
                                                                                                                                                                                                                                                                                                                                      Ξ

                                                                                                                    The present sequence is a cDNA obtained from Incyte clone 640521 of BRSTNOT03 library. It encodes cell signalling protein-2 (CSIGP-2). It is expressed in reproductive, nervous and developmental tissues. Fragments of CSIGP encoding nucleic acid can be used as hybridisation probe for detecting CSIGP related sequences or allelic variants. Recombinant CSIGP each be produced in host cells by transforming them with genetically engineered vectors. Agonists or antagonists can be used in the treatment of cell proliferative and inflammatory disorders associated with prevention and treatment of CSIGP expression. CSIGP is used in the diagnosis, prevention and treatment of cell proliferative disorders like atteriosclerosis, cirrhosis, cancer, hepatitis and inflammatory disorders like AIDS, Addison's disease, multiple sclerosis, etc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method protate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level level indicates that the patient is afflicted with prostate cancer. Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB7517ADB7531 represent marker cNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention relates to newly discovered cancer markers associated with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to methods of detecting a prostate cancer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting a prostate cancer-associated transcript in a cell in a patient, useful for diagnosing prostate cancer (PC) or screening modulators of PC, by determining if prostate cancer-associated genes are expressed in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for

diagnosing and treating prostate cancer in mammals. The prostate cancer-
associated genes are useful for diagnosing or treating prostate cancer,
as well as for identifying modulators of prostate cancer or agents that
inhibit prostate cancer. The nucleic acid sequences are particularly
useful in gene therapy, as a vaccine or in antisense applications.

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB75177-ADB75631 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CAGGGGCCCCCATTGAGCAGGTGTACCAGGAAATTGCCATCCTCAAGAAGCTGGACCACCC 389

The method of the invention involves assessing whether a patient is afflicted with prostate cancer. The method prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer.
                                                                                                                                                                                                                                                                                                     GGTGAAGTCCATGCTGAGGAAGCGTTCCTTTGGGAACCCGTTTGAGCCCCCAGGCACGGAG

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38649-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous of the invention may be used to treat diseases of the peripheral nervous injuries, peripheral nervous injuries, peripheral nervopathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic alteral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CAGTGGGAAGGCCTTGGATGTATGGGCCCACTGGCGTCACGTTGTACTGCTTTGTCTATGG 1046

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
